

After reviewing the protagonist selection (which was automatically conducted based on the number of lines in the kaggle character data), I noticed that the selection is of poor quality. Specifically, I noticed that neither “Golden eye” nor “Goldfinger” had James Bond as the protagonist if selection is carried out as planned. Reviewing the kaggle data revealed that the included character files were sometimes incomplete, thereby, for instance, implying that James Bond is less prominent in the movies than characters like “M”.

Thus, the protagonist selection procedure was transferred to a web-search enabled LLM (gpt-4.1-mini). The according python script was added to the repository. The previous protagonist selection procedure was kept in the repository as well to allow for replication of the observed errors.
